

Merits, Demerits and Characteristry of digital IC.

monits

- It reduces overall size of the System.
- It reduces overall cost of the system.
- It improves reliability of the system, by reducing Inter convolor of wiring.
- It reduces power Consuption of the System.

Deminits

- It can not handle large power.
- Electrical devices like resistors, inductors, transformer 4 large capacitors can not be implemented with great precision on chip.
- They are suitable for Low power applications.

Character 1stry

- 1. Propagation delay
- 2. Thousand Voltage.
- 3. Power dissipation
- 4. Figure of Merit
- 5. Fan out and fan in
- 6. Noise immunity
- 7. Operating Temp.
- 8. Voltage and current pasameters.

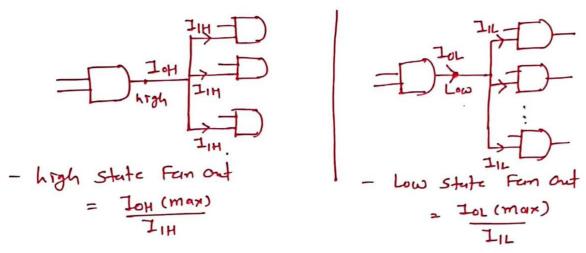

Characteristics of digital IC Il Propageition Delay & Thresold Voltage - It is average transition time of signal from Up to 0/p. - It defines operating speed of IC. - It is measured in teams of usee. lagic high Inpt output -> tp = tpln + tphL where, tpy = delay with O/P goes from Low to high > tpy = 5 nsec tPHL = delay with op goes from high to lov tpHL = 7 nsce tp = 5+7 = 6 nsee 2) Power dissipatorn of IC - It is the amount of power dosipated in an IC in form of heat. - Total power dissipation Pa = Vax Ice (arg) - Suppulj Voltage VI -> TTL - where Ice = Icen + Icel YDD - CMOS - Power dissipation per lugare getes Pan = Vcc x lee carg) 9. Va = 5 V, Jech = 0.5 mA, Jech = 1 mA, P1 = 9 - Ice = Tech + Jul 2 1.5 = 0.75 mf

3) Figure of Mesit = progertom delay x power descipation.

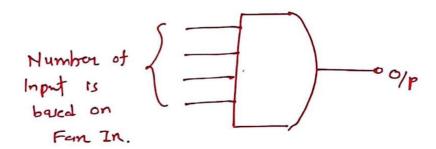

- Pd = Ice Va = 5 x 0.75 = 3.75 mW

Characteristics of digital IC

- Fan out
- No of similar getes can be driven by a gete without importing normal operation of given circuit is Fan out
- It should be as high as passible, so that we can drive large number of gates by single gete.
- It defines (urrent supply by given gete.

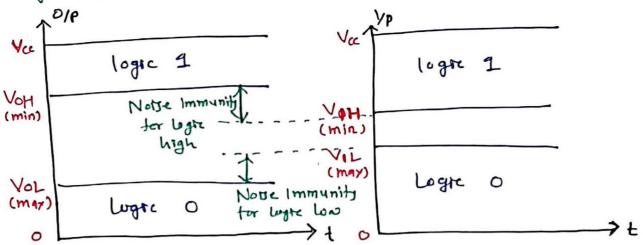

- Fan In
- Form in of Logic gerte is defined on the number of inputs that the gete is designed to hundle.

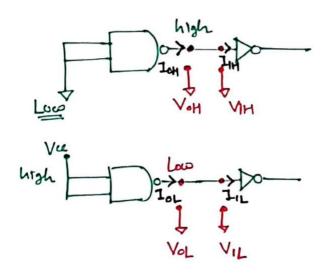

Openating Temp.

- For Commodal appliations [0 to 70'c]
- For Industrial applications [o to 85°c]
- For Military applications [-ssoc to 125°c].

Charactonisters of degital IC Voltage and current Pasametous

VOH (min) — It is min 0/p valt for Logic 1 IOH > high Level 0/p Count
VOL (max) — It is min 0/p valt for Logic 0 IOL -> Low Level 0/p Count
VIH (min) — It is min Vp valt for Logic 1 IIH -> high Level Vp Count
VIL (max) — It is max Vp valt for Logic 0 IIL -> Low Level Vp Count

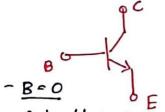

NMH = VOH - VIH
NML = VIL - VOL

Resister Tounsieter Logic [RTL]

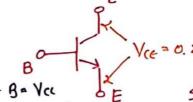

- -> This legic family Includes resisters and transistors in 14's Integrated Circuit. So, It is retraced as RTL family.
- -> How we use tounsister in Saturation and cut off region.

 so, speed of this lugic family is Low.

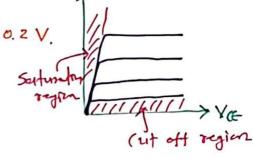

- (ut off region

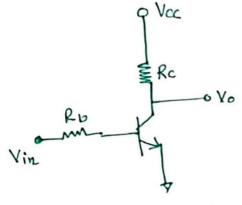

- C to E terminal act like Open Clauit.

- Saturation region

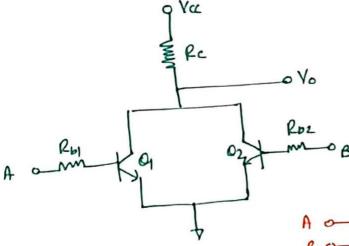

- c to E (word) will flow.

JIP \	9/8	Touncistor
Low high	high Low	cut off [O.C] scat. [Vec = 0.2 Y]

Vp 0 00 0/P

A	В	٧o
لمما	low	high
Lucu	hrsh	Low
hrgh	low	Low
high	h hosh	LOW

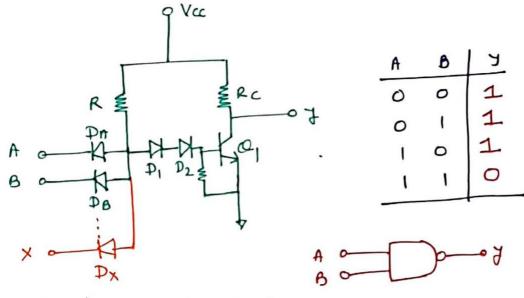

A o Y

Driadrantuges

- Low Noise mazzin
- Low fan at
- Low speed
- high power drisipation

Diode Transister Logic [PTL]

- RTL termilies hus low NM, low fam out, Slow Speed & higher power dissipation. So, we don't use FTL in recent 10's.
- DTL hus Improved NM and Fam out compared to RTL.

Transistor Transistor Logic (TTL) TTL Classifications - Standard TTL - TTL totempole Output TTL Open Collection Output TTL Tristate. TTL offered higher speed compared to RTL and DTL TTL NAND Cloouit 9 Vac [5 Y] Vo В C 0 0 1 1 PC2 & Reg

TTL tristate Lugic

- In tristate at of we have three State

- Il logiz high
- 2) lugge low
- 3) High Impedence state.
